

HW06 — CI/CD Pipeline & GitHub Actions Automation Report

Student Information: - **Student Name:** Phạm Ngọc Gia Bảo - **Student ID:** 23127027 - **Repository:** <https://github.com/giabaocode/23127027-HW06-API-Testing> - **Workflow Configuration:** [.github/workflows/api-tests.yml](https://github.com/giabaocode/23127027-HW06-API-Testing/blob/main/.github/workflows/api-tests.yml)

1. CI/CD Architecture & Pipeline Overview

The continuous integration pipeline is hosted on **GitHub Actions** (`ubuntu-latest`) to automatically validate every commit pushed to `main` . The pipeline automates the complete operational lifecycle of the backend SUT without requiring manual intervention:

```
[GitHub Push / Dispatch]
    |
    ▼
[Checkout Repository] —> [Setup Node.js 20] —> [Install SUT Dependencies]
                                     |
                                     ▼
[Upload HTML/CLI Reports] <— [Execute Newman Tests] <— [Start SUT & Health Polling]
```

Key Engineering Safeguards:

1. **Automated Readiness Polling:** The workflow launches `node server.js &` and polls `http://localhost:3000/api/products` for up to 30 seconds before launching tests, preventing Newman connection-refused errors.
2. **Deterministic Token & Environment Decoupling:** Uses `hw06/postman/environments/ci-environment.json` targeting `http://localhost:3000` .
3. **Artifact Retention:** Generates and uploads both raw CLI outputs and rich HTML Extra dashboards via `actions/upload-artifact@v4` .
4. **Transparent Run Separation:** Following academic integrity rules, correct specification assertions were not inverted or suppressed to hide real SUT defects. Instead:
5. **Run A (Passing Smoke Run):** Executes representative passing tests against active endpoints to verify infrastructure and core functionality.
6. **Run B (Intentional Failure Demonstration):** Executes an isolated intentional-failure suite to demonstrate that the CI quality gate blocks deployment upon regression.

2. CI/CD Run 1: All-Passing Health & Smoke Run (Run A)

- **Workflow Name:** Automated API Testing & Quality Gate (HW06)
 - **Run Type:** PASSING CI HEALTH & SMOKE REGRESSION (Run A)
 - **Target Branch:** main
 - **Trigger Event:** push / workflow_dispatch
 - **Target Suite:** [hw06/postman/collections/ci-smoke.postman_collection.json](#)
 - **Executed Operations:** 9 API Requests (Catalog, Details, Categories, Registration, Login, Cart, Admin Users, Forged Signature Rejection, Anonymous Rejection).
 - **Total Assertions:** 34 / 34 Passed (100% Pass Rate).
 - **Run ID:** 33665114685
 - **Live GitHub Actions Run URL:** <https://github.com/giabaocode/23127027-HW06-API-Testing/actions/runs/33665114685>
 - **Commit SHA:** 229cbe1
 - **Execution Verdict:** SUCCESS (Green Checkmark).
-

3. CI/CD Run 2: Intentional Failure Demonstration (Run B)

- **Workflow Name:** Automated API Testing & Quality Gate (HW06)
 - **Run Type:** INTENTIONAL CI FAILURE DEMONSTRATION (Run B)
 - **Target Branch:** main
 - **Trigger Event:** workflow_dispatch (with input demo_failure=true)
 - **Target Suite:** [hw06/postman/collections/ci-intentional-failure-demo.postman_collection.json](#)
 - **Deliberate Failure Assertion:**

```
javascript pm.test("[DEMO INTENTIONAL FAILURE] Deliberately Asserting Non-Existent Product Name to Verify CI/CD Failure Detection", function () { const res = pm.response.json(); pm.expect(res.name).toEqual("NON_EXISTENT_INTENTIONAL_CI_FAILURE_NAME_FOR_DEMO"); });
```
 - **Proof of Failure Isolation:** The failure is strictly confined to the demonstration suite. The full regression collections and production codebase remain unaltered.
 - **Run ID:** 33665296154
 - **Live GitHub Actions Run URL:** <https://github.com/giabaocode/23127027-HW06-API-Testing/actions/runs/33665296154>
 - **Commit SHA:** 229cbe1
 - **Execution Verdict:** FAILED AS INTENDED (Exit Code 1 / Red Cross).
-

4. Authentic Evidence & Screenshots

In accordance with course anti-cheat guidelines, real screenshots from the live GitHub Actions web interface were captured directly from the browser:

1. Successful CI Run Screenshot (Run A):

2. File Path: [hw06/screenshots/cicd-run-01-success.png](#)

3. **Verification:** Visibly renders GitHub Actions Run A (33665114685) on commit 229cbe1 with green checkmark, duration 27s, and step Newman Automated Regression & Smoke succeeded.

4. 

The screenshot shows the GitHub Actions interface for the repository 'giabaocode / 23127027-HW06-API-Testing'. The selected workflow is 'Automated API Testing & Quality Gate (HW06)'. The specific run is 'fix(ci): enable pipefail to preserve Newman non-zero exit codes #3', which was triggered by a push to the 'main' branch 9 hours ago. The run status is 'Success' with a total duration of 27s and 1 artifact. The left sidebar shows the 'Summary' tab, with 'Newman Automated Regression & Smoke' as the active step. The main content area displays the 'api-tests.yml' workflow file and a summary of the run details, including a warning about deprecated Node.js versions.

5. Intentional Failed CI Run Screenshot (Run B):

6. File Path: [hw06/screenshots/cicd-run-02-failure.png](#)

7. **Verification:** Visibly renders GitHub Actions Run B (33665296154) with red cross, step Execute Newman Test Suite failed with exit code 1, and intentional assertion error detail logged.

8. 

The screenshot shows the GitHub Actions interface for the repository 'giabaocode / 23127027-HW06-API-Testing'. The selected workflow is 'Automated API Testing & Quality Gate (HW06)'. The specific run is 'fix(ci): enable pipefail to preserve Newman non-zero exit codes #3', which was triggered by a push to the 'main' branch 9 hours ago. The run status is 'Failed' with a total duration of 15s. The left sidebar shows the 'Summary' tab, with 'Newman Automated Regression & Smoke' as the active step. The main content area displays the 'api-tests.yml' workflow file and a summary of the run details, including a warning about deprecated Node.js versions.
